Introduction to Applied Linear Algebra Vectors MA

Linear algebra is a fundamental branch of mathematics that deals with vectors, vector spaces, and linear transformations. Its applications permeate various scientific and engineering disciplines, including computer science, physics, economics, data analysis, and more. Among the core concepts within linear algebra, vectors serve as the building blocks for understanding and solving complex problems. This article provides a comprehensive overview of applied linear algebra vectors, focusing on their role in mathematical analysis, computational methods, and practical applications.

What Are Vectors in Linear Algebra?

In the context of linear algebra, vectors are quantities characterized by both magnitude and direction. They are typically represented as ordered lists of numbers, known as components or elements, which describe their position or state within a vector space.

Definition of Vectors

A vector v in an n -dimensional space (denoted as $\mathbb{R}^n$) is an ordered n -tuple:

$$v = (v_1, v_2, \dots, v_n)$$

Each component v_i is a real number, and the entire vector describes a point or a directed quantity in n -dimensional space.

Representation of Vectors

Vectors can be represented in various ways:

- Column vector form:

$$\mathbf{v} = \begin{bmatrix} v_1 \\ v_2 \\ \vdots \\ v_n \end{bmatrix}$$

\]

- Row vector form:

\[

$$\mathbf{v} = \begin{bmatrix} v_1 & v_2 & \dots & v_n \end{bmatrix}$$

\]

- Graphical representation: As arrows in 2D or 3D space, starting from the origin to the point defined by its components.

Fundamental Operations on Vectors

Applied linear algebra relies heavily on operations involving vectors, which facilitate the analysis of systems and transformations.

Vector Addition

Adding two vectors involves summing their corresponding components:

- For vectors $\mathbf{u} = (u_1, u_2, \dots, u_n)$ and $\mathbf{v} = (v_1, v_2, \dots, v_n)$,

\[

$$\mathbf{u} + \mathbf{v} = (u_1 + v_1, u_2 + v_2, \dots, u_n + v_n)$$

\]

Scalar Multiplication

Multiplying a vector by a scalar k scales each component:

- \[

$$k \mathbf{v} = (k v_1, k v_2, \dots, k v_n)$$

\]

Dot Product (Inner Product)

The dot product measures the similarity or angle between two vectors:

- \[

$$\mathbf{u} \cdot \mathbf{v} = u_1 v_1 + u_2 v_2 + \dots + u_n v_n$$

\]

- The dot product is useful in calculating projections and angles.

Cross Product (for 3D vectors)

A special operation in three-dimensional space, producing a vector perpendicular to two vectors:

- For $\mathbf{u} = (u_1, u_2, u_3)$ and $\mathbf{v} = (v_1, v_2, v_3)$,

\[

$$\mathbf{u} \times \mathbf{v} = (u_2 v_3 - u_3 v_2, u_3 v_1 - u_1 v_3, u_1 v_2 - u_2 v_1)$$

\]

Vector Spaces and Subspaces

Understanding vectors within the framework of vector spaces is essential for their application in various fields.

Vector Spaces

$$\|\mathbf{v}\|_1 = |v_1| + |v_2| + \dots + |v_n|$$

]

- Maximum norm (L ∞):

[

$$\|\mathbf{v}\|_{\infty} = \max_{1 \leq i \leq n} |v_i|$$

]

Distance Between Vectors

- The Euclidean distance between $\mathbf{u}$ and $\mathbf{v}$:

[

$$d(\mathbf{u}, \mathbf{v}) = \|\mathbf{u} - \mathbf{v}\|_2$$

]
