Developing a Basic Satellite Orbit Simulator in MATLAB

Let's explore the key components involved in creating a satellite orbit simulation:

Step 1: Define Orbital Parameters

Set initial conditions based on mission requirements:

- Semi-major axis (a)
- Eccentricity (e)
- Inclination (i)
- Argument of periapsis (?)
- Longitude of ascending node (?)
- True anomaly (?)

Example:

```
```matlab
```

```
a = 7000; % km
```

```
e = 0.001; % Near circular
```

```
i = deg2rad(98); % degrees to radians
```

```
Omega = deg2rad(0);
```

```
omega = deg2rad(0);
```

```
nu = deg2rad(0);
```

```
...
```

## Step 2: Convert Orbital Elements to Cartesian Coordinates

Use classical orbital element to state vector conversions, such as:

```
```matlab
```

```
[r_vec, v_vec] = orbitalElementsToStateVectors(a, e, i, Omega, omega, nu, mu);
```

```
...
```

Where μ is Earth's gravitational parameter ($\sim 398600 \text{ km}^3/\text{s}^2$).

Step 3: Propagate the Orbit Over Time

For a simple two-body problem, Kepler's equations can be used to find position at different time steps:

- Solve Kepler's Equation for eccentric anomaly.
- Compute position in orbital plane.
- Rotate into Earth-centered inertial frame.

For example:

```
```matlab
```

```
times = 0:dt:period; % Time vector
```

```
positions = zeros(length(times),3);
```

```
for idx = 1:length(times)
```

```
M = meanMotion times(idx);
```

```
E = solveKeplersEquation(M, e);
```

```
[r, v] = orbitalPositionFromEccentricAnomaly(E, a, e, mu);
```

```
positions(idx,:) = r;
```

```
end
```

```
```
```

Step 4: Visualization

Plot the orbit in 3D:

```
```matlab
```

```
plot3(positions(:,1), positions(:,2), positions(:,3));
```

```
xlabel('X (km)');
```

```
ylabel('Y (km)');
```

```
zlabel('Z (km)');
```

```
title('Satellite Orbit Simulation');
```

```
grid on;
```

```
axis equal;
```

```
```
```

Incorporating Perturbations and Advanced Dynamics

For realistic simulations, consider additional forces:

- Earth's Oblateness (J2 effect): Causes node regression and perigee rotation.
- Atmospheric Drag: Significant for low Earth orbits; modeled as a decelerating force.
- Third-Body Effects: From the Moon or Sun.

Implementing these requires extending the equations of motion:

```
```matlab
```

```
dRdt = v;
```

```
dVdt = -mu R / norm(R)^3 + perturbationForces(R, V);
```

```
```
```

Use MATLAB's numerical solvers:

```
```matlab
```

```
[t, state] = ode45(@(t, y) satelliteDynamics(t, y, mu), tspan, initialState);
```

```
```
```

where ``satelliteDynamics`` encapsulates the equations of motion including perturbations.
