Title of the Study

The Impact of Mindfulness-Based Stress Reduction on Anxiety Levels Among Postoperative Cardiac Surgery Patients?

Background and Rationale

Postoperative patients often experience heightened anxiety, which can impede recovery and

negatively affect health outcomes. While pharmacological interventions are common, non-pharmacological approaches like mindfulness-based stress reduction (MBSR) have gained attention for their potential benefits. Existing literature suggests that MBSR can reduce anxiety, but its application in cardiac surgery patients remains underexplored. This study aims to evaluate the effectiveness of MBSR in reducing anxiety among this patient group, filling a critical gap in nursing practice and holistic patient care.

Problem Statement

High levels of postoperative anxiety in cardiac surgery patients can hinder recovery, increase stress-related complications, and diminish quality of life. There is limited evidence regarding the effectiveness of mindfulness-based interventions in this population, necessitating research to inform nursing practices and improve patient outcomes.

Research Questions and Objectives

- Primary Research Question: Does participation in MBSR reduce anxiety levels among postoperative cardiac surgery patients?
- Specific Objectives:
 - To measure baseline anxiety levels in postoperative cardiac patients
 - To implement an 8-week MBSR program tailored for cardiac surgery patients
 - To compare pre- and post-intervention anxiety levels
 - To assess patient satisfaction and perceived benefits of MBSR

Theoretical Framework

The study is grounded in the Mindfulness-Based Stress Reduction theory, which posits that mindfulness practices cultivate awareness and acceptance, leading to reduced psychological distress. This framework supports evaluating whether MBSR can effectively mitigate anxiety in a postoperative setting.

Literature Review

Extensive review of current literature indicates that mindfulness interventions can significantly decrease anxiety and improve psychological well-being in various patient populations. However, specific evidence in cardiac postoperative care is limited, highlighting the need for targeted research to validate these benefits.

Methodology

Research Design

This study will adopt a quantitative, quasi-experimental pre-test/post-test design with a control group.

Population and Sample

- Population: Postoperative cardiac surgery patients admitted to a tertiary hospital
- Sample Size: 60 patients (30 in intervention group, 30 in control group)
- Sampling Technique: Convenience sampling with random assignment to groups

Inclusion and Exclusion Criteria

- Inclusion:
 - Adults aged 40-70 years
 - Undergoing first-time cardiac surgery
 - Able to understand and consent to participation
- Exclusion:
 - Patients with diagnosed psychiatric disorders
 - Patients already practicing mindfulness or meditation
 - Severe cognitive impairments

Intervention

The intervention group will participate in an 8-week MBSR program, including weekly 1-hour group sessions led by a certified instructor, supplemented with daily home practice. The control group will receive standard postoperative care without additional interventions.

Data Collection Methods

- Primary Data: State-Trait Anxiety Inventory (STAI) administered at baseline, week 4, and week

- Secondary Data: Patient satisfaction questionnaires and qualitative feedback

Data Analysis

Statistical analysis will involve paired t-tests to assess within-group changes and independent t-tests for between-group comparisons. A significance level of p

Ethical Considerations

- Approval from the Institutional Review Board (IRB)
- Informed consent from all participants
- Confidentiality and anonymity maintained throughout
- Right to withdraw without penalty

Budget and Resources

- Personnel: MBSR instructor, research assistant
- Materials: Printed materials, questionnaires, meditation aids
- Facilities: Conference rooms for sessions
- Estimated Budget: \$5,000

Timeline

- Proposal approval: 1 month
- Recruitment and baseline data collection: 2 months
- Intervention period: 2 months
- Follow-up data collection: 1 month
- Data analysis and report writing: 2 months

Conclusion: Significance of the Research Proposal

This nursing research proposal exemplifies the critical components necessary for a systematic investigation aimed at improving patient care. By exploring the impact of mindfulness-based stress reduction on postoperative anxiety among cardiac patients, the study aligns with holistic nursing principles and evidence-based practice. The insights gained can potentially inform nursing interventions, enhance patient satisfaction, and contribute to the growing body of knowledge on non-pharmacological anxiety management strategies.
