Définition et caractéristiques principales

Le syndrome d'Asperger est une condition neurodéveloppementale qui fait partie du spectre autistique. Contrairement à d'autres formes d'autisme, il ne s'accompagne généralement pas de retard intellectuel ou de troubles du langage significatifs. Les personnes atteintes présentent plutôt des difficultés dans la communication sociale et des intérêts ou comportements restreints et répétitifs.

Historique et reconnaissance

Découvert par le pédiatre autrichien Hans Asperger dans les années 1940, le syndrome a été longtemps considéré comme une entité distincte. Depuis la publication du DSM-5 en 2013, il est intégré dans la classification du trouble du spectre autistique, mais le terme « syndrome d'Asperger » reste couramment utilisé pour désigner cette forme spécifique.
